

MAS345

UNIVERSITY OF NEWCASTLE UPON TYNE

SCHOOL OF MATHEMATICS AND STATISTICS

Semester 1 Mock

MAS345

Algebraic Geometry of Curves

Time: 1 hour 30 minutes

*Credit will be given for all answers to questions in Section A, and for the best TWO answers to questions in Section B.*

*No credit will be given for other answers and students are strongly advised not to spend time producing answers for which they will receive no credit.*

*Marks allocated to each question are indicated.*

*There are FOUR questions in Section A and THREE questions in Section B.*

**Section A**

**A1.** Let  $l_1$  be the affine line with equation  $2x - 7y - 3 = 0$  and  $l_2$  be the affine line with equation  $5x + y - 6 = 0$ .

- (a) Find the equation and parametric form of the line  $l$  parallel to  $l_2$  through the point  $(2, 1)$ .
- (b) Find the point of intersection of  $l$  and  $l_1$ .

**9 marks**

**A2.** Let  $f$  be the polynomial  $f = 3y^2 + x^3 - y - 2x^2$  and let  $C$  be the affine curve with equation  $f = 0$ .

- (a) Find the intersections of  $C$  with the following lines and the corresponding intersection numbers.
  - i. The line  $l_0$  with equation  $x + y = 0$ .
  - ii. The line  $l_1$  with equation  $x = 0$ .
  - iii. The line  $l_2$  with equation  $y = 0$ .
- (b) Write down the homogenization  $F$  of the polynomial  $f$  and let  $D$  be the projective curve with equation  $F = 0$ . Let  $L$  be the projective line with equation  $x = 0$ . Find the points of intersection of  $D$  with  $L$  and the corresponding intersection numbers. Say which points of  $D \cap L$  correspond to points of  $C \cap l_1$  (and to which ones) and which do not.

**12 marks**

**A3.** Show that the polynomial  $f = x^3 + y^3 + xy$  is irreducible.

**10 marks**

**A4.** Let  $C$  be a curve of degree  $d$  and suppose that  $C$  has  $m$  singularities lying on a line  $l$ .

- (a) Show that if  $2m > d$  then  $l \subseteq C$ . (If you use any results from the course, say so.)
- (b) Show that if  $C$  is irreducible then  $2m \leq d$ .

**9 marks**

### Section B

**B5.** Let

$$f(x, y) = (x^2 + y^2)^2 - x^2y - y^3$$

and let  $C$  be the complex curve with equation  $f = 0$ .

- (a) Find all the singular points of  $C$ .
- (b) Find the multiplicity of each singular point of  $C$ .
- (c) Find parametric forms (or equations if you prefer) for all the tangents to  $C$  at all singular points.
- (d) Write down the homogenization  $F$  of  $f$ . Find all the singular points of the curve with equation  $F = 0$  and their multiplicities.

**30 marks**

**B6.** Let  $C$  and  $D$  be projective curves of degree  $n$  which intersect in exactly  $n^2$  points. Assume that precisely  $mn$  of these points lie on an irreducible curve  $E$  of degree  $m$ , with  $m < n$ . Let  $f$ ,  $g$  and  $h$  be the polynomials defining  $C$ ,  $D$  and  $E$  respectively.

- (a) Let  $(a : b : c)$  be a point of  $E$  which is not in  $C \cap D$ . Let  $\lambda = g(a, b, c)$  and  $\mu = -f(a, b, c)$ . Show that the polynomial  $s = \lambda f + \mu g$  has degree  $n$  and that  $C_s \cap E$  contains at least  $nm + 1$  points (where  $C_s$  is the curve with equation  $s = 0$ ).
- (b) Show, quoting any major theorems that you use, that  $E$  and  $C_s$  have a common component. Conclude that  $E$  is a component of  $C_s$ .
- (c) Show that  $s = ht$  for some polynomial  $t$  of degree at most  $n - m$ .
- (d) Prove that the remaining  $n(n - m)$  points of  $C \cap D$  lie on a curve of degree at most  $n - m$ .

**30 marks**

- B7.** (a) Define a *point of inflexion* of a projective curve.  
 (b) Define the *Hessian* of the curve  $C$  with equation  $f = 0$ .  
 (c) Let

$$f = x^3 + y^3 + z^3$$

and let  $C$  be the complex curve with equation  $f = 0$ .

- i. Show that  $C$  is non-singular and find all its points of inflexion.
- ii. The Group Law is defined on  $C$ , taking the identity element  $O$  to be the inflexion  $(0 : -1 : 1)$ . Let  $A = (-1 : 0 : 1)$  and  $B = (-\omega : 0 : 1)$ , where  $\omega = e^{i2\pi/3}$ . Find the point  $A + B$  of  $C$ .
- iii. Given that the Group Law is defined on  $C$  as in part (cii) above, prove (using properties of curves) that the inverse of the identity  $O$  is  $O$ .
