Department of Statistics

Practical session on Minitab, descriptive statistics and the Normal distribution: outline solutions

1.

The file HEIGHT.MTW is opened by clicking on $\underline{File} \rightarrow \underline{O}pen$ Worksheet and then selecting the file in the usual Windows manner. The screen below shows the results of selecting $\underline{S}tat \rightarrow \underline{B}asic Statistics \rightarrow \underline{D}escriptive Statistics...$ and entering C1 (or 'Heights cm') in the $\underline{V}ariables$: box and clicking on $\underline{O}K$. The box and whisker plot comes from $\underline{G}raph \rightarrow \underline{B}oxplot...$ with C1 under Y in the $\underline{G}raph$ variables:... box.

The mean (labelled Mean) and standard deviation (labelled StDev) appear in the output in the session window. The median is labelled as such and the lower and upper quartiles are labelled Q1 and Q3 respectively. Note that the Describe command gives other information, such as the standard error and the minimum and maximum (TrMean is a trimmed mean, a quantity we will not use, that attempts to combine the advantages of a mean and a median) 2.

The data can be typed into the data window and the column for haemoglobin concentrations is named as Hbs. Applying the method for finding means used in question 1 gives a mean of 15.253 g/dl and an SD of 1.461 g/dl. If the second column of data is entered in a column which has name 'sex' then the way to obtain separate means and SDs for the sexes is to click OK on the screen as set out below.

Doing this gives the following output in the session window.

```
MTB > Describe 'Hbs';
SUBC> By 'sex'.
```

Descriptive Statistics

Variable Hbs	sex 1 2	N 7 8	Mea 13.92 16.41	an 29 .3	Media 14.20 16.20	in 00 00	Tr Mea 13.92 16.41	an 29 13	StDe 0.75 0.70	v 0 6	SE Mean 0.283 0.250
Variable Hbs	sex 1 2	12. 15.	Min 900 800	N 14.8 17.8	Max 300 300	13. 15.	Q1 200 825	14. 16.	Q3 600 900		

3.

Clicking on the path suggested in the question leads to the following dialogue box, which should be filled in as shown.

On clicking $\underline{O}K$ the following is written to the Session window.

MTB > CDF 1.65; SUBC> Normal 1.78 0.172.

Cumulative Distribution Function

```
Normal with mean = 1.78000 and standard deviation = 0.172000

x P( X <= x)

1.6500 0.2249
```

Which shows that 0.2249, or about $22\frac{1}{2}$ % of this population lies below 1.65 log units.

4.

The answer to this question is found in a way that is almost the same as for question 3. The dialogue box is that shown in the answer to question 3 but the <u>Inverse</u> cumulative probability button, rather than the <u>Cumulative probability button</u> should be checked. The value 77.5% must be entered in the Input constant box as 0.775, i.e. as a probability or proportion, not a percentage. Doing this and clicking on <u>OK</u> gives the following output in the Session window:

MTB > InvCDF 0.775; SUBC> Normal 1.78 0.172.

Inverse Cumulative Distribution Function

Normal with mean = 1.78000 and standard deviation = 0.172000 P(X <= x) x 0.7750 1.9099

Thus 77.5% of the population have a value of the variable measuring photo-toxicity that is less than approximately 1.91 log units.

The proportion above this value is 1-0.775 = 0.225, i.e. the same proportion that is below 1.65 (cf. question 3). From the symmetry of the Normal distribution this implies that 1.91 is the same distance above the mean as 1.65 is below it. As the mean is 1.78, this is indeed the case, 1.78-1.65 = 1.91-1.78 = 0.13.

5.

Using the method of question 4, with an Input constant box of 0.05 gives a threshold of 8.3551.

Following the procedure for generating random numbers given in the question leads to the following screen:

Clicking on OK produces 100 Normal numbers from a *population* with mean 10 and SD 1 (i.e. this is a special case where we know m=10, s=1).

Computing descriptive statistics using the methods of questions 1 and 2, and then using the method suggested in the question to determine the number of values less than the threshold and computing a classification table leads to the following session window.

MINITAB - Untitled Worksheet - [Session]		_ 8 ×

Notice that the *sample* mean and SD, *m* and *s*, are not exactly 10 and 1, but vary from these values by sampling variation (their values are, respectively, 9.8374 and 0.9659).

The table shows that 7 of the 100 values are below 8.3551, so 7% rather than 5% fall below the 5% threshold. This is only to be expected - the number falling below 8.3551 will, *on average*, be 5%, it just will not be guaranteed to be 5% in every sample. This can be appreciated by repeating the instruction to form a column of 100 numbers from a Normal population of mean 10 and SD 1. This gives the sample statistics and number below the threshold shown overleaf: the percentage below the 5% threshold is now 3%.

Descriptive Statistics

Variable N Mean Median Tr Mean StDev SE Mean C1100 10.037 9.936 10.013 0.904 0.090 Variable Min Max 01 03 7.888 10.433 9.557 C1 12.680 MTB > Let C2=(C1<8.3551)MTB > Table C2.

Tabulated Statistics

Rows: C2 Count 0 97 1 3 All 100

If the instruction to form a column of 100 values is replaced by a similar instruction to form 10000 values then the descriptive statistics obtained are:

MTB > Random 10000 C1; SUBC> Normal 10 1. MTB > Describe C1.

Descriptive Statistics

Variable	N	Mean	Median	Tr Mean	StDev	SE Mean
Cl	10000	10.012	10.008	10.012	1.004	0.010
Variable Cl	Min 5.693	Max 13.562	Q1 9.333	Q3 10.674		

Note how much closer the sample mean and variance, 10.012 and 1.004, are to their population counterparts, 10 and 1, in this much larger sample.

Using exactly the same methods as before shows that 470 of the 10,000 values are below 8.3551, i.e. 4.7% of this sample is below the 5% point.

(note that because this question uses randomly generated values, the answers above will not, in general, be the same as those shown here. However, in the previous copy of the MINITAB screen the Session window contains the line:

MTB > Base 4321.

This sets the random number seed to a specific value and this in turn means that if you type this command before generating the random numbers then the first two sets of 100 numbers and the subsequent 10,000 should be the same as used here. You do not have to type the Base command when using random numbers in MINITAB, it is just that if you do you set the generator to a reproducible state.}
